

Salesforce Administrator Course Syllabus

Archer Infotech, Kothrud Pune | Classroom & live-online batches | Updated September 2026

Course Overview

This syllabus lists every module of the course in teaching order, with the topics covered in each. It is generated from the course page, so the two cannot disagree.

Module 1: CRM Concepts & the Salesforce Platform

Schedule: Week 1

What a CRM is for before what Salesforce does, because an administrator who does not understand the business problem configures the wrong solution competently. Leads, accounts, contacts, opportunities and cases as business concepts, then as platform objects.

You set up your own Developer Edition org in the first session and keep it for the rest of the course and afterwards. Editions, licences, the Setup menu, Lightning Experience navigation and the app launcher follow, along with Trailhead — used alongside the teaching with a set sequence, not handed over instead of it.

Topics

- What a CRM is for, in business terms
- Salesforce clouds and what each covers
- Editions, licences and org types
- Creating and keeping your own Developer org
- Lightning Experience navigation and the app launcher
- The Setup menu and where things live
- Standard objects — leads, accounts, contacts, opportunities, cases
- Trailhead, trailmixes and superbadges
- Release cycles and staying current

Module 2: Users, Profiles, Roles & Permission Sets

Schedule: Week 2

The security model, which is the administrator's core responsibility and the part interviews probe hardest. User setup and licences; profiles as the baseline of what a user can do; permission sets and permission set groups as the additive layer that modern Salesforce prefers to profile proliferation.

Roles are covered separately from profiles because conflating the two is the single most common beginner error: a profile decides what you can do, a role decides whose records you can see. You build a working model for a fictional organisation and then test it by logging in as each user.

Topics

- Creating users, licences and user management
- Profiles and what they control
- Permission sets and permission set groups
- Profiles versus permission sets in modern practice
- The role hierarchy and record visibility
- Public groups and queues
- Login history, password policies and session settings
- Multi-factor authentication requirements
- Login As and testing a security model

Module 3: The Security Model — Sharing, OWD & Field-Level Security

Schedule: Week 3

Record-level access in depth. Organisation-wide defaults as the floor, then the mechanisms that open access back up: role hierarchy, sharing rules, manual sharing and team access. The order matters and the exam tests it, so you work through scenarios and predict the outcome before checking.

Field-level security and page layouts control what a user sees on a record they can already access — a distinction candidates routinely blur. The module closes on restriction rules, and on the practical discipline of documenting a sharing model so the next administrator can understand it.

Topics

- Organisation-wide defaults
- Role hierarchy and record access inheritance
- Ownership-based and criteria-based sharing rules
- Manual sharing and account teams
- Field-level security versus page layout visibility
- Restriction rules and scoping rules
- Predicting effective access in a scenario
- Auditing and documenting a sharing model
- Common security misconfigurations

Module 4: Objects, Fields & Relationships**Schedule: Week 4**

Data modelling, which is where an administrator's decisions have the longest consequences. Standard against custom objects; field types and the ones that cannot be changed later; and relationships — lookup, master-detail, hierarchical and many-to-many through a junction object.

The master-detail versus lookup decision gets extended treatment because it determines cascade delete, roll-up summaries and record ownership, and it is difficult to reverse once records exist. You model a real business scenario end to end and defend the choices.

Topics

- Standard and custom objects
- Field types and choosing correctly
- Formula fields and roll-up summaries
- Lookup versus master-detail relationships
- Junction objects and many-to-many
- Hierarchical relationships
- Schema Builder and the object manager
- Record types and page layout assignment
- Modelling a business scenario from requirements

Module 5: Page Layouts, Lightning Pages & the User Interface**Schedule: Week 5**

What the user actually sees, and the difference between an org people use and one they work around. Page layouts, compact layouts and record types; the Lightning App Builder for dynamic record pages; and dynamic forms, which increasingly replace layout proliferation.

List views, filters, kanban and the search behaviour users rely on. The judgement taught here is restraint: every field you add to a layout costs attention, and an administrator's job includes saying no to requests that would clutter the page for everyone.

Topics

- Page layouts, compact layouts and related lists
- Record types and layout assignment
- Lightning App Builder and record pages
- Dynamic forms and dynamic actions
- Custom apps, tabs and navigation
- List views, filters and kanban
- Global search and search layouts
- Home page and utility bar configuration
- Designing for the user, not the requester

Module 6: Validation Rules & Data Quality

Schedule: Week 6

Keeping the data worth reporting on, which is the quiet half of the job. Validation rules with the formula syntax they use, required fields, duplicate rules and matching rules, and the trade-off every rule carries: each one prevents bad data and adds friction for a user who then finds a way around it.

Data management covers imports with the Data Import Wizard and Data Loader, external IDs and upsert, mass updates and deletion, and the recycle bin. You clean a deliberately messy dataset, which is closer to the real job than any greenfield exercise.

Topics

- Validation rules and formula syntax
- Required fields, dependent picklists and defaults
- Duplicate rules and matching rules
- Data Import Wizard versus Data Loader
- External IDs and upsert operations
- Mass update, transfer and delete
- Recycle bin and data recovery
- Data quality auditing
- Balancing enforcement against usability

Module 7: Flow Builder & Declarative Automation

Schedule: Weeks 7–8

The automation engine, and the skill that most separates a capable administrator from someone who can only configure fields. Flow types — screen, record-triggered, scheduled, autolaunched and platform-event-triggered — and what each is for.

You build flows with variables, collections, loops, decisions, assignments and get, create and update elements; add fault paths, because a flow without one fails silently in production; and cover before-save against after-save triggers and the performance difference. Approval processes and the legacy Workflow and Process Builder are covered for the orgs you will inherit that still use them.

Topics

- Flow types and choosing between them
- Screen flows and guided user experiences
- Record-triggered flows, before and after save
- Variables, collections, loops and decisions
- Get, create, update and delete elements
- Fault paths and error handling
- Scheduled and platform-event flows
- Subflows and reusable logic
- Approval processes

- Legacy Workflow and Process Builder in inherited orgs
- Debugging a flow and reading the debug log

Module 8: Reports & Dashboards

Schedule: Week 9

Turning the data into the answers a manager actually asks for. Report types and why a custom report type is often the missing piece; tabular, summary, matrix and joined formats; filters, cross filters, bucketing and row-level formulas.

Dashboards cover component types, dynamic dashboards, filters, and running-user context — which is where dashboards quietly leak data if the running user is set carelessly. The module closes on the skill that matters most: starting from the question being asked rather than from the report builder.

Topics

- Report types and custom report types
- Tabular, summary, matrix and joined reports
- Filters, cross filters and filter logic
- Bucketing, groupings and summary formulas
- Row-level formulas
- Charts and conditional formatting
- Dashboard components and layout
- Dynamic dashboards and running user
- Subscriptions and scheduled reports
- Starting from the question, not the builder

Module 9: Sales & Service Cloud for Administrators

Schedule: Week 10

The two clouds an administrator is most often asked to configure. Sales Cloud covers the lead-to-cash process: lead conversion, opportunity stages and sales path, products and price books, quotes, forecasting and campaign influence.

Service Cloud covers case management: case creation channels, assignment and escalation rules, queues, entitlements and milestones, knowledge articles, and the omni-channel routing basics. Both are taught as configuration decisions driven by a business process rather than as feature tours.

Topics

- Lead management, conversion and assignment rules
- Opportunity stages, sales path and forecasting
- Products, price books and quotes
- Campaigns and campaign influence
- Case creation channels — email, web, phone
- Assignment rules, escalation rules and queues
- Entitlements, milestones and service contracts
- Knowledge articles and case deflection
- Omni-channel routing basics
- Configuring from a documented process

Module 10: AppExchange, Sandboxes & Change Management

Schedule: Week 11

Working in an org other people depend on. Sandboxes and their types, what refreshes and what does not, and the discipline of building somewhere other than production — which every administrator learns either in a course or through an incident.

Deployment covers change sets, packages and an introduction to Salesforce DX, plus the AppExchange evaluation questions worth asking before installing anything: what permissions it wants, what happens when it is uninstalled, and who supports it. Release management and the three annual Salesforce releases close the module.

Topics

- Sandbox types and refresh behaviour
- Building outside production
- Change sets and deployment
- Packages and an introduction to Salesforce DX
- AppExchange evaluation and permissions
- Managed versus unmanaged packages
- The three annual releases and preview orgs
- Release notes and impact assessment
- Documenting configuration for the next administrator

Module 11: Certification Preparation & Exam Strategy

Schedule: Week 12 + placement prep

Structured preparation for the Salesforce Certified Administrator exam, which is the credential Pune employers screen on. The exam's sections and their weightings, the question style — scenario-based rather than recall — and the pacing that gets you through the paper with time to review flagged items.

You sit timed mock papers, work through the questions you got wrong rather than the ones you got right, and close the gaps that shows up. Booking, proctoring and the maintenance requirement are covered plainly, along with the standing point that the exam fee is paid to Salesforce, never to us.

Topics

- Exam sections and their weightings
- Scenario question style and how to read one
- Timed mock papers and pacing
- Working through wrong answers systematically
- Booking, proctoring and identification
- The maintenance requirement each release
- Trailhead superbades as evidence
- Building an interview-ready org walkthrough
- Resume and LinkedIn for administrator roles
- Mock interviews on configuration scenarios

Module 12: AI-Assisted Administration & Agentforce Awareness

Schedule: Final Week

Where AI sits for an administrator in 2026, framed the way our career guide frames it: on top of fundamentals, not instead of them. Einstein features an administrator configures, Prompt Builder, and an orientation to Agentforce — agents, actions and grounding — at the level of understanding what is being asked for when it appears in a requirement.

The standing caveat is repeated because it matters: a fresher who learns Agentforce without understanding the object model and Flow will not clear an interview. The rest of the module covers using AI assistants responsibly for formula writing, documentation and release-note triage, with every suggestion reviewed before it reaches an org.

Topics

- Einstein features an administrator configures
- Prompt Builder and prompt templates
- Agentforce — agents, actions and grounding
- Why AI sits on top of the object model and Flow

- Data quality as the prerequisite for useful AI
- AI assistants for formula and validation-rule drafting
- Generating documentation and release-note summaries
- Reviewing every AI suggestion before it reaches an org
- Data privacy when using external AI tools
- A small AI-assisted configuration task, end to end
