

Salesforce Business Analyst Course Syllabus

Archer Infotech, Kothrud Pune | Classroom & live-online batches | Updated September 2026

Course Overview

This syllabus lists every module of the course in teaching order, with the topics covered in each. It is generated from the course page, so the two cannot disagree.

Module 1: The Business Analyst Role & Salesforce Delivery

Schedule: Week 1

What the role actually does on a Salesforce project, and where it sits between the client, the administrator, the developer and the project manager. Delivery methodologies — agile, waterfall and the hybrid most Pune consulting partners actually run — and the artefacts expected at each stage.

You set up a Developer Edition org in the first session, because an analyst who has never configured anything writes requirements that cannot be built.

Topics

- The analyst's remit and its boundaries
- Where the role sits in a delivery team
- Agile, waterfall and hybrid delivery
- Sprints, ceremonies and the analyst's part in each
- Artefacts expected at each stage
- Setting up your own Salesforce org
- Stakeholder types and their different concerns
- Reading a statement of work

Module 2: Salesforce Platform Literacy for Analysts

Schedule: Weeks 1–2

Enough platform to make your requirements buildable. Objects, fields, relationships and record types; the security model at concept level; declarative automation and what Flow can and cannot do; reports and dashboards.

The emphasis throughout is on constraints rather than features — which decisions are hard to reverse, what a roll-up summary requires, why a request that sounds simple may not be. Knowing the boundary is the analyst's value.

Topics

- Objects, fields and relationships
- Record types and page layouts
- Profiles, permission sets and sharing at concept level
- What Flow can and cannot do
- Reports, dashboards and reporting constraints
- Standard Sales and Service Cloud processes
- Decisions that are hard to reverse
- AppExchange and build-versus-buy

Module 3: Requirement Elicitation & Stakeholder Management

Schedule: Week 3

The craft half of the role. Interview technique, workshop facilitation, observation and document analysis; managing stakeholders who disagree with each other; and the specific skill of getting to the actual problem when you have been handed a proposed solution.

You practise on live role-play scenarios with deliberately incomplete and contradictory briefs, which is closer to the job than any tidy case study.

Topics

- Interview technique and open questioning
- Workshop facilitation and getting a room to decide
- Observation and document analysis
- Getting behind a proposed solution to the problem
- Managing conflicting stakeholders
- Handling scope creep in the conversation
- Stakeholder mapping and influence
- Recording decisions so they hold

Module 4: Business Process Mapping & Analysis

Schedule: Week 4

Turning what people say into something a team can build against. As-is and to-be process mapping, swimlanes, BPMN basics, and the discipline of mapping what actually happens rather than what the policy says happens.

Gap analysis, process improvement and the honest judgement about which inefficiencies are worth automating — because automating a bad process makes it faster and no better.

Topics

- As-is and to-be process mapping
- Swimlane diagrams and BPMN basics
- Mapping actual behaviour, not documented policy
- Gap analysis and prioritisation
- Root-cause analysis
- Deciding what is worth automating
- Process documentation standards
- Validating a map with the people who do the work

Module 5: User Stories, Acceptance Criteria & Backlog

Schedule: Week 5

The artefact the build team actually works from. Writing user stories that carry intent rather than a UI instruction, acceptance criteria that are testable, and the INVEST characteristics that separate a workable story from a wish.

Backlog management, prioritisation frameworks such as MoSCoW and weighted scoring, epics and story mapping, and estimation participation. You write a full backlog for the scenario you mapped in week four.

Topics

- User story structure and intent
- Testable acceptance criteria
- The INVEST characteristics
- Epics, features and story mapping
- Backlog grooming and refinement
- MoSCoW and weighted prioritisation
- Non-functional requirements
- Participating in estimation without owning it
- Traceability from requirement to story

Module 6: Data Requirements, Migration & Reporting Analysis

Schedule: Week 6

The parts of a Salesforce project that most often go wrong late. Data requirements and modelling from a business perspective; data quality rules; and migration analysis — source systems, mapping, cleansing and the reconciliation nobody plans time for.

Reporting requirements are treated as a first-class deliverable rather than an afterthought, since a report that cannot be built because of how the data was modelled is a requirements failure, not a reporting one.

Topics

- Data requirements from a business perspective
- Field-level requirements and picklist governance
- Data quality rules and ownership
- Migration source analysis and mapping
- Cleansing, deduplication and reconciliation
- Reporting requirements as a deliverable
- Reporting constraints that follow from the data model
- Data retention and privacy considerations

Module 7: Solution Design Participation & Documentation

Schedule: Week 7

Contributing to how something gets built without pretending to be the architect. Evaluating declarative against programmatic options at a level that lets you challenge an estimate; build-versus-buy against AppExchange; and the trade-off conversations where an analyst earns their place.

Documentation covers functional specifications, solution design documents, configuration workbooks and the change log that stops a project's history being lost.

Topics

- Declarative versus programmatic, at analyst level
- Build, buy or configure — evaluating AppExchange
- Challenging an estimate constructively
- Functional specification writing
- Solution design documentation
- Configuration workbooks
- Decision logs and change history
- Handover documentation

Module 8: Testing, UAT & Change Management

Schedule: Week 8

Getting the built thing accepted. Test planning from acceptance criteria, writing test scripts business users can actually follow, coordinating user acceptance testing, and triaging defects against whether they are a bug or a missed requirement — a distinction that decides who pays.

Change management covers training material, communication, adoption measurement and the reality that a technically successful Salesforce rollout nobody uses is a failed project.

Topics

- Test planning from acceptance criteria
- Writing test scripts for business users
- Coordinating and running UAT
- Defect triage — bug or missed requirement
- Sign-off and go-live readiness
- Training material and user guides
- Communication and adoption planning

- Measuring adoption after go-live
- Hypercare and post-go-live support

Module 9: Certification Preparation & Portfolio

Schedule: Week 9 + placement prep

Preparation for the Salesforce Certified Business Analyst credential — its sections, weightings and scenario question style — with timed mock papers and systematic work through wrong answers.

Alongside it, the portfolio: a complete requirements pack from your scenario — process maps, user stories, acceptance criteria, a data mapping and a UAT plan — which is what an interviewer actually wants to see from an analyst rather than a certificate number.

Topics

- Certified Business Analyst exam sections and weightings
- Scenario question technique and pacing
- Timed mock papers and gap closure
- Assembling a requirements portfolio
- Presenting a process map at interview
- Resume and LinkedIn for analyst roles
- Mock interview — elicitation and stakeholder scenarios
- Mock interview — platform literacy questions
- Booking, proctoring and maintenance

Module 10: AI-Assisted Analysis & Agentforce Awareness

Schedule: Final Week

Where AI helps an analyst and where it misleads. Drafting user stories and acceptance criteria, summarising workshop notes, generating first-pass process documentation and test scripts — all reviewed, because an assistant will confidently invent a requirement nobody stated.

Agentforce is covered at analyst level: what an agent, an action and grounding are, and what a business is actually asking for when it requests one. The career guide's caveat holds — AI sits on top of process and data understanding, not instead of it.

Topics

- Drafting user stories and acceptance criteria with AI
- Summarising workshops and interview notes
- Generating first-pass documentation and test scripts
- Reviewing for invented requirements
- Agentforce at analyst level — agents, actions, grounding
- What a business is really asking for when it requests AI
- Data quality as the prerequisite for useful AI
- AI governance questions an analyst should raise
- Confidentiality when using external AI tools
