

Salesforce Consultant Track Syllabus

Archer Infotech, Kothrud Pune | Classroom & live-online batches | Updated September 2026

Course Overview

This syllabus lists every module of the course in teaching order, with the topics covered in each. It is generated from the course page, so the two cannot disagree.

Module 1: The Consultant's Remit & Engagement Models

Schedule: Week 1

What a consultant is accountable for that an administrator is not. Engagement shapes — fixed-scope implementation, time and materials, managed service, staff augmentation — and how each changes what you can promise. Discovery, statements of work, and the commercial context a delivery sits inside.

The module sets the standard the rest of the course holds you to: every design decision must be defensible to a client who is paying for it.

Topics

- What a consultant owns beyond configuration
- Engagement models and what each permits
- Discovery structure and outputs
- Statements of work and scope boundaries
- Commercial context of a delivery
- Working within a partner delivery methodology
- Client expectations and how they are set
- Escalation and when to raise a risk

Module 2: Discovery, Scoping & Estimation

Schedule: Week 2

The phase that decides whether a project succeeds, conducted before anyone has agreed anything. Running discovery workshops with client stakeholders, current-state assessment, and turning findings into a scope that can be delivered in the time and budget available.

Estimation is taught as a discipline with its failure modes named: optimism on integration, silence on data migration, and the standard omission of testing and change management. You estimate a real scenario and then defend it.

Topics

- Running a discovery workshop
- Current-state assessment
- Turning findings into a deliverable scope
- Estimation techniques and ranges
- Estimating integration and migration honestly
- Assumptions, dependencies and exclusions
- Risk identification and mitigation
- Defending an estimate under pressure

Module 3: Sales Cloud Implementation

Schedule: Weeks 3–4

Implementing the lead-to-cash process rather than configuring its features. Lead capture, qualification, assignment and conversion; opportunity stages designed around how the client's sales team actually works; products, price books and

quoting; forecasting; territory management.

The recurring judgement is fitting the platform to the business without letting the business recreate its worst existing habits in a new system.

Topics

- Lead capture, assignment and conversion design
- Opportunity stages and sales process design
- Products, price books and quoting
- Forecasting and forecast categories
- Territory management
- Campaign influence and attribution
- Sales productivity features
- Fitting the platform to an actual sales process

Module 4: Service Cloud Implementation

Schedule: Weeks 4–5

Case management as a designed system. Channels — email, web, phone, chat — case assignment, escalation and queues; entitlements, milestones and service contracts; knowledge management and deflection; omni-channel routing and capacity models.

Service implementations fail most often on routing design and on knowledge nobody maintains, so both get more time than their feature complexity would suggest.

Topics

- Case channels and capture design
- Assignment rules, queues and escalation
- Entitlements, milestones and service contracts
- Knowledge management and article lifecycle
- Case deflection and self-service
- Omni-channel routing and capacity
- Service console design
- CSAT and service reporting

Module 5: Data Migration & Integration Scoping

Schedule: Week 6

The two areas that most often blow an engagement's timeline. Migration strategy — source analysis, mapping, cleansing, sequencing, reconciliation and the cutover rehearsal that is always cut and always needed.

Integration is scoped rather than built: identifying the systems, choosing patterns, understanding volumes and latency, deciding between point-to-point and middleware, and being able to tell a client what an integration will actually cost before agreeing to it.

Topics

- Migration strategy and sequencing
- Source analysis, mapping and cleansing
- Reconciliation and cutover rehearsal
- Integration patterns and when each fits
- Volume, latency and API limit implications
- Point-to-point versus middleware
- Scoping an integration credibly
- Third-party and AppExchange evaluation

Module 6: Solution Design & Governance

Schedule: Week 7

Designing something that will still work in two years. Declarative-first decision making with a clear threshold for when code is warranted; multi-org and single-org considerations; and technical debt as something a consultant actively prevents rather than inherits.

Governance covers design authority, documentation standards, environment strategy and release management — the structures that keep a client org from degrading after the consultants leave.

Topics

- Declarative-first, and the threshold for code
- Designing for maintainability
- Single-org versus multi-org considerations
- Preventing technical debt in a design
- Design authority and review
- Environment and release strategy
- Documentation standards for handover
- Designing for the administrator who inherits it

Module 7: Change Management, UAT & Go-Live

Schedule: Week 8

Landing the change with people who did not ask for it, which is where technically successful Salesforce projects most often fail. Stakeholder communication, training design for different user groups, and adoption measurement that is honest about whether anyone is using the system.

UAT coordination, defect triage against scope, go-live readiness criteria, cutover planning and hypercare. The module ends on the post-go-live review most engagements skip.

Topics

- Change management and communication planning
- Training design for different user groups
- Adoption measurement and honest reporting
- UAT coordination and sign-off
- Defect triage against agreed scope
- Go-live readiness criteria
- Cutover planning and rollback
- Hypercare and transition to support
- Post-implementation review

Module 8: Client Communication & Difficult Conversations

Schedule: Week 9

The skill that separates consultants who are asked back from consultants who are competent. Running a steering meeting, presenting a design to people who will not read the document, saying no to a scope change without damaging the relationship, and delivering bad news early rather than hoping.

Taught through role-play with deliberately difficult scenarios — a slipping timeline, a stakeholder who changed their mind, a client blaming the platform for a process problem.

Topics

- Running a steering meeting
- Presenting a design to a non-technical audience
- Saying no to scope change constructively

- Delivering bad news early
- Managing a stakeholder who has changed position
- Handling blame directed at the platform
- Written communication that holds up later
- Building a relationship that survives a difficult project

Module 9: Certification, Engagement Simulation & Positioning

Schedule: Week 10 + placement prep

A full engagement simulation — discovery, scope, estimate, design, build plan, UAT approach and a client presentation — assessed the way a delivery lead would assess it. That artefact is what a consulting partner interview actually explores.

Alongside it, preparation for the Sales Cloud and Service Cloud Consultant credentials, and positioning: repositioning an administrator or analyst CV for consulting, and answering the interview question about an engagement you owned.

Topics

- End-to-end engagement simulation
- Client presentation and defence
- Sales Cloud Consultant exam preparation
- Service Cloud Consultant exam preparation
- Scenario question technique and pacing
- Repositioning an administrator or analyst CV
- Answering questions about an engagement you owned
- Mock interview — design and estimation scenarios
- Mock interview — client-handling scenarios

Module 10: AI, Agentforce & Advising Clients About It

Schedule: Final Week

What a consultant needs to say when a client asks for AI, which in 2026 they will. Agentforce, Data Cloud and Einstein at the level of scoping an engagement: what they need in place first, what they realistically deliver, and what they cost.

Our career guide's caveat becomes a consulting tool here — AI sits on top of strong CRM, data and platform foundations, so the most valuable advice a consultant often gives is that the client's data quality has to be fixed before any agent will be useful. Advising against a purchase is sometimes the engagement.

Topics

- Agentforce, Data Cloud and Einstein at scoping level
- Prerequisites a client must have in place first
- What AI features realistically deliver
- Cost and licensing implications
- Data quality as the blocking dependency
- Advising against a premature AI purchase
- AI governance and risk questions clients should ask
- Scoping an AI-enabled engagement
- Using AI assistants in your own delivery work
