

Salesforce Data & Analytics Course Syllabus

Archer Infotech, Kothrud Pune | Classroom & live-online batches | Updated September 2026

Course Overview

This syllabus lists every module of the course in teaching order, with the topics covered in each. It is generated from the course page, so the two cannot disagree.

Module 1: Salesforce Data Model & Platform Foundations

Schedule: Week 1

The platform from a data perspective. Objects, fields and relationships as a schema; standard object relationships in Sales and Service Cloud; record types and how they complicate reporting; and the security model, because record visibility silently changes every number a report produces.

You set up your own org and load a deliberately imperfect dataset that the rest of the course works against.

Topics

- Objects, fields and relationships as a schema
- Standard Sales and Service Cloud data relationships
- Record types and their reporting consequences
- Sharing, visibility and how they change report totals
- Data types, precision and formula fields
- Setting up your own org and loading real data
- Schema Builder and documenting a model
- Where Salesforce data differs from a warehouse

Module 2: Data Quality, Governance & Stewardship

Schedule: Week 2

The unglamorous foundation everything else rests on. Profiling a dataset to find what is actually wrong with it; duplicate and matching rules; validation and picklist governance; and the ownership question — who is accountable for a field being correct.

The discipline taught is measurement: a data quality dashboard that reports completeness, validity and duplication over time turns an opinion into a metric someone can be held to.

Topics

- Profiling a dataset and finding what is wrong
- Duplicate rules, matching rules and merge strategy
- Validation rules and picklist governance
- Required-field policy and its cost
- Data ownership and stewardship
- Completeness, validity and consistency metrics
- Building a data quality dashboard
- Remediation planning and prioritisation

Module 3: Reports & Dashboards to Analytical Depth

Schedule: Weeks 3–4

Standard reporting taken well past where most administrators stop. Custom report types, which are usually the missing piece when a report cannot be built; joined reports; cross filters; bucketing; row-level formulas; and summary formulas with the PARENTGROUPVAL functions people rarely reach for.

Dashboards cover dynamic dashboards, running-user context and its data-leak risk, filters and subscriptions. The framing throughout is starting from the question rather than the builder.

Topics

- Custom report types and why reports fail without them
- Joined reports and multiple blocks
- Cross filters and filter logic
- Bucketing and row-level formulas
- Summary formulas and PARENTGROUPVAL
- Dynamic dashboards and running user
- Running-user context as a data-leak risk
- Subscriptions, scheduling and delivery
- Starting from the question, not the builder

Module 4: Data Migration, Loading & Integration

Schedule: Week 5

Getting data in and out reliably. Data Loader and the Bulk API for volume; external IDs and upsert; sequencing loads so relationships resolve; and the reconciliation step that proves a migration actually worked rather than merely finished.

Integration covers the patterns that feed analytics: scheduled extracts, event-driven updates, Change Data Capture, and external objects with Salesforce Connect for data that should not be copied at all.

Topics

- Data Loader, Bulk API and volume handling
- External IDs and upsert semantics
- Load sequencing and relationship resolution
- Reconciliation and proving a migration worked
- Error handling and partial failure
- Scheduled extracts and ETL patterns
- Change Data Capture and event-driven updates
- External objects and Salesforce Connect

Module 5: CRM Analytics

Schedule: Weeks 6–7

Salesforce's analytics platform, for the questions standard reports cannot answer. Datasets, dataflows and recipes; joining Salesforce data with external sources; SAQL basics; lenses, dashboards and bindings.

Security gets particular attention because CRM Analytics has its own sharing model that does not inherit from the org automatically — a genuine source of accidental exposure. You build a dashboard answering a question that standard reporting cannot.

Topics

- Datasets, dataflows and recipes
- Joining Salesforce and external data
- SAQL basics and when you need it
- Lenses, dashboards and bindings
- Row-level security in CRM Analytics
- Why it does not inherit org sharing
- Scheduling and dataset refresh
- Choosing between standard reports and CRM Analytics

Module 6: Data Cloud Fundamentals

Schedule: Week 8

Unifying customer data across systems, which is the capability Agentforce and modern personalisation depend on. Data streams and ingestion; the data model and mapping to it; identity resolution and how a unified profile is actually assembled; calculated insights and segmentation.

Covered honestly, including cost and complexity: Data Cloud is a substantial commitment and the right advice for many organisations is to fix their core data quality first.

Topics

- Data streams and ingestion sources
- The Data Cloud data model and mapping
- Identity resolution and unified profiles
- Calculated insights
- Segmentation and activation
- Data Cloud with Sales and Service Cloud
- Cost and complexity considerations
- When to fix core data quality first

Module 7: Tableau & Visual Analytics**Schedule: Week 9**

Visualisation as a communication discipline. Connecting Tableau to Salesforce data; the grammar of building a view; calculated fields, table calculations and level-of-detail expressions; and dashboard design that answers a question rather than displaying everything available.

The standard taught is that a chart which requires explanation has failed, and that the choice of chart type is an argument about what matters.

Topics

- Connecting Tableau to Salesforce data
- Building views and the visual grammar
- Calculated fields and table calculations
- Level-of-detail expressions
- Choosing a chart type as an argument
- Dashboard layout and information hierarchy
- Interactivity, filters and actions
- Publishing, permissions and refresh

Module 8: Analytics Build & Certification Preparation**Schedule: Week 10 + placement prep**

A full analytics build on your own messy dataset: a documented data model, a quality remediation, a reporting pack, a CRM Analytics dashboard, and a written note on what the data cannot answer and why — which is the part that reads as senior.

Alongside it, preparation for the Data Cloud Consultant and CRM Analytics credentials, and mock interviews on data modelling, reporting constraints and quality scenarios.

Topics

- End-to-end analytics build
- Documenting a data model and its limitations
- Data Cloud Consultant exam preparation
- CRM Analytics credential preparation
- Mock interview — data modelling scenarios
- Mock interview — reporting and quality scenarios

- Presenting an analysis to a business audience
- Resume and LinkedIn for data roles

Module 9: AI, Agentforce & the Data It Needs

Schedule: Final Week

Why this specialisation matters more than it did. Agentforce grounds an agent on org and unified data, which means data quality, structure and governance now determine whether an AI feature works at all — the point our career guide makes when it says AI sits on top of strong CRM and data knowledge.

Covered practically: what an agent needs from your data model, how grounding actually retrieves it, Einstein prediction features and their data requirements, and the governance questions to raise before any of it is switched on.

Topics

- How grounding retrieves org and unified data
- What an agent needs from your data model
- Data quality as the determinant of AI usefulness
- Einstein prediction features and their data requirements
- Segmentation and activation for AI use cases
- AI governance, consent and data privacy
- Advising honestly against premature AI adoption
- Using AI assistants for analysis and documentation
